VeriCall

VeriCall is a Web3-powered AI phone assistant that filters out scam and unsolicited sales calls, while identifying and prioritizing truly important calls.

Explainable AI
Users can always review why the AI classified a call as a scam or an important call.
VeriCall is not a black box — its decision logic is transparent, auditable, and continuously improvable.

Decision-Making Based on Mathematical Logic
The AI does not rely on intuition or vague predictions.
Every decision must pass through predefined rules and conditions,
making intentional misjudgment or manipulation structurally impossible.

Verification with ZK and Smart Contracts
Call judgment records are stored on smart contracts.
Using zero-knowledge proofs (ZK), VeriCall proves that the AI followed the correct decision process,
without revealing call contents or any personal information.

VeriCall is an AI phone assistant that explains its decisions, cannot lie, and proves their correctness using zero-knowledge cryptography.
